DETAILED ACTION

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claims 16 and 17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pavate et al (US 6,001,227). Pavate et al disclose a target having essentially no

dielectric inclusions such as metal oxides (Al_2O_3), nitride precipitates, carbide precipitates, of sizes larger than about 1 micron in concentrations greater than 5,000 such inclusions per gram of target material (col.12, lines 49 to 62) but does not explicitly disclose a target material being substantially free of inclusions of the size of "800 μm and greater" or "400 μm or greater" but the size of '227 inclusions being not "larger than about 1 micron" overlaps the claimed range therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to optimize the size range of inclusions the motivation being to avoid localized melting of the target which may splatter onto the wafer.
